MODULAR CONSTRUCTION FAQ PART 1

BASE4
Architects | Engineers | Designers

FUNDAMENTALS

Q-1 What is modular construction?

A delivery method where building sections (modules) are prefabricated in a factory and then transported and assembled onsite.
The parallel path (factory + site work at the same time) compresses schedule, improves quality, and reduces risk.

Q-2 Why should developers consider modular?

Faster speed-to-market (factory build while site work proceeds)
Lower carrying costs (loan open period)
Consistent quality (factory QA, repeatable details)

Q-3 How does modular compare to traditional construction?

30–50% faster delivery (parallel workstreams)
Fewer delays (weather exposure, fewer change orders)
Less waste (controlled production)

Q-4 Can modular meet code & brand standards?

Yes. Modular complies with **IBC/local codes and brand requirements.**
Factory teams work with brand reviewers—modules are dimensionally consistent and adaptable.

Q-5 Does modular limit design flexibility?

No. Modular supports unique layouts and customizations within modular grids, while still capturing speed and repeatability.

Q-6 What about HVAC in modular projects?

PTAC = lower upfront, easier replacement, higher operating cost
DOAS = higher upfront, **better comfort, efficiency, and IAQ**
Choice depends on brand standards, energy goals, and lifecycle.

ROI & COST

Q-7 How does modular save developers money?

Reduced interest carry (earlier revenue)
Lower rework & change orders (standardized details)
Fewer schedule hits (weather + coordination)

Q-8 Does modular still make sense if factory pricing seems high?

Yes. Value is captured in compressed **schedules, quality,** and **reduced rework**.
BASE4 helps developers weigh upfront pricing vs. lifecycle value, reduced change orders, and design freeze benefits.
